The World of Git and GitHub

**Typical (bad)
version control**

time

1. To be or not to be
2. that is the question

shakespeare-2019-01-25.txt

1. To be or not to be,
2. That is the question!

shakespeare-2019-02-08.txt

1. To be or not to be
2. That is the question!
3. Life = 42

shakespeare-2019-02-12.txt

1. To be or not to be
2. That is the question!
3. Life = 42
4. The end.

Simple version control system

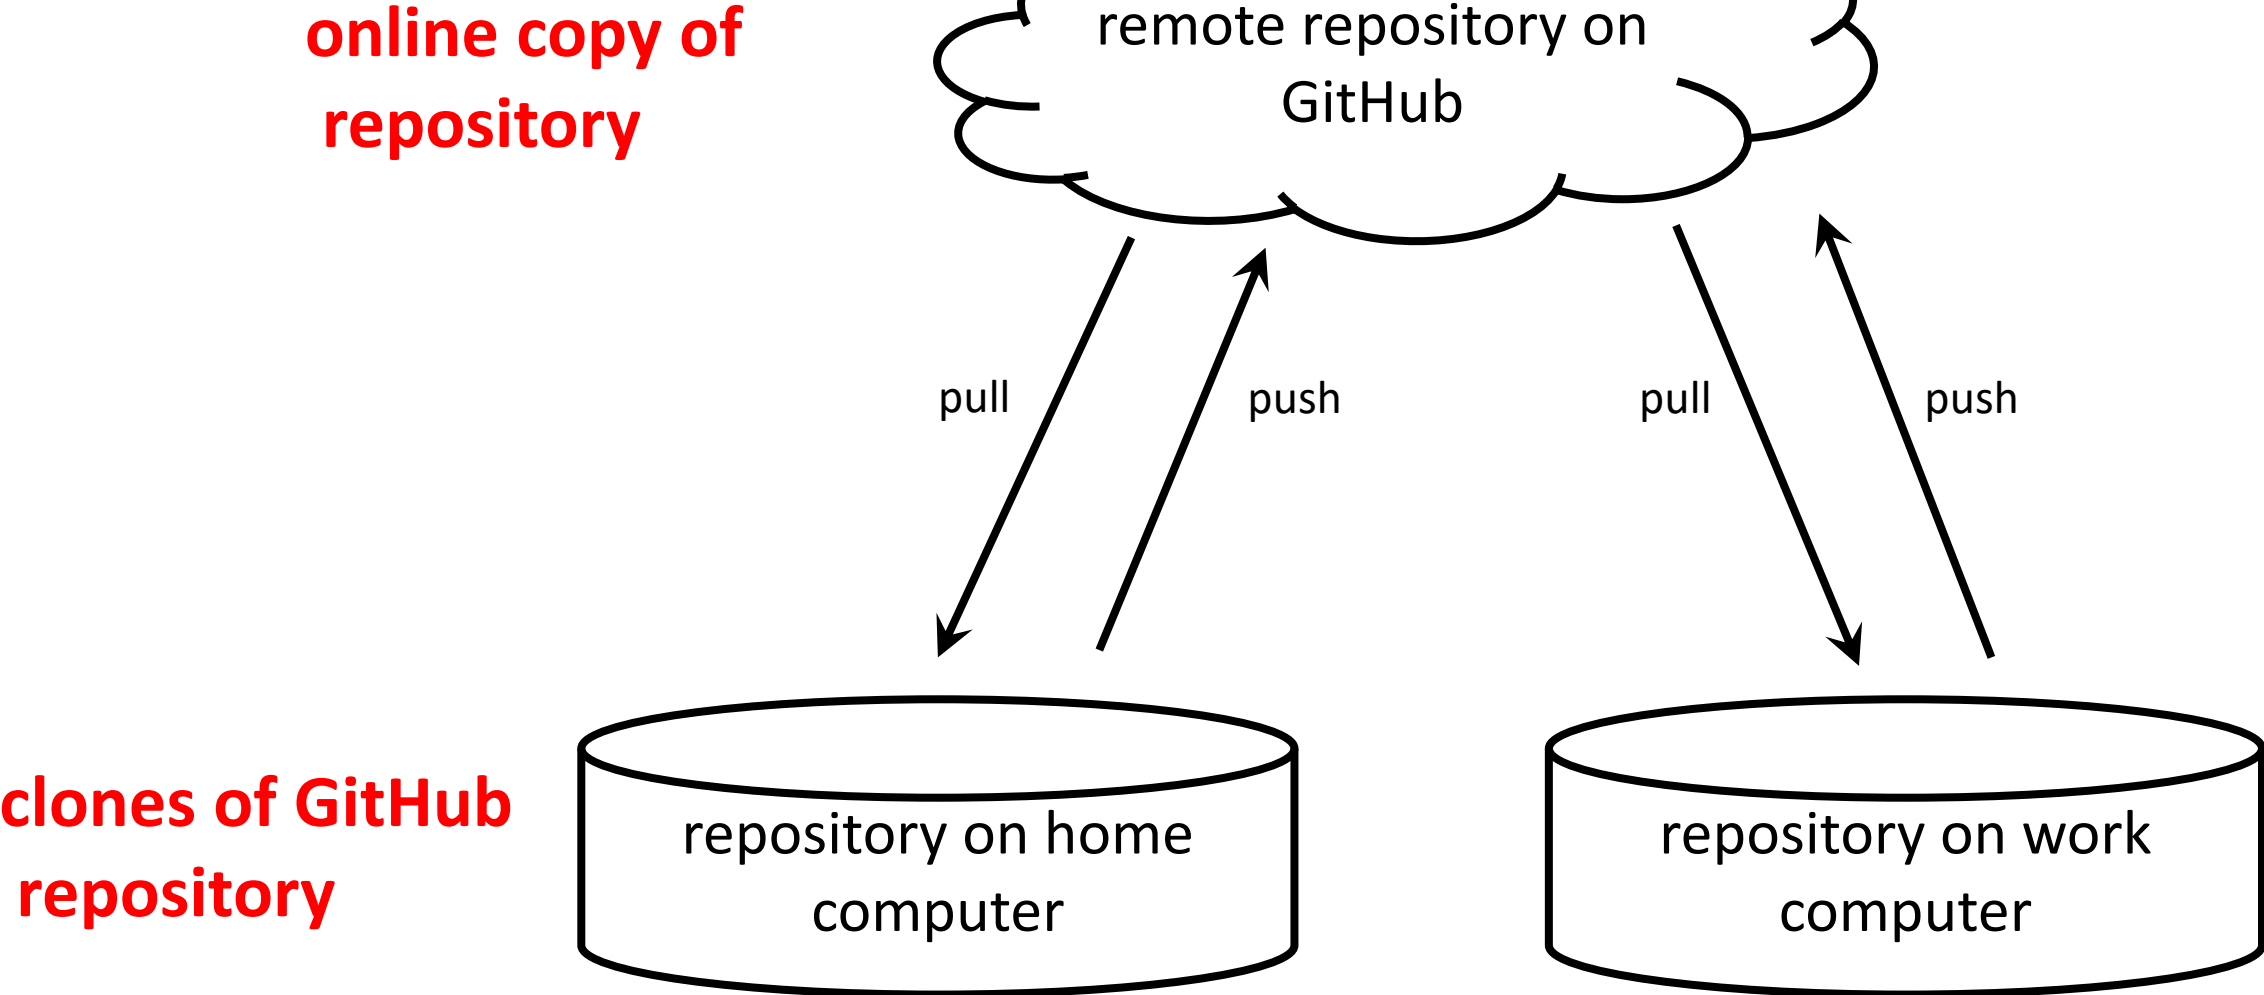

Local version control for disaster prevention

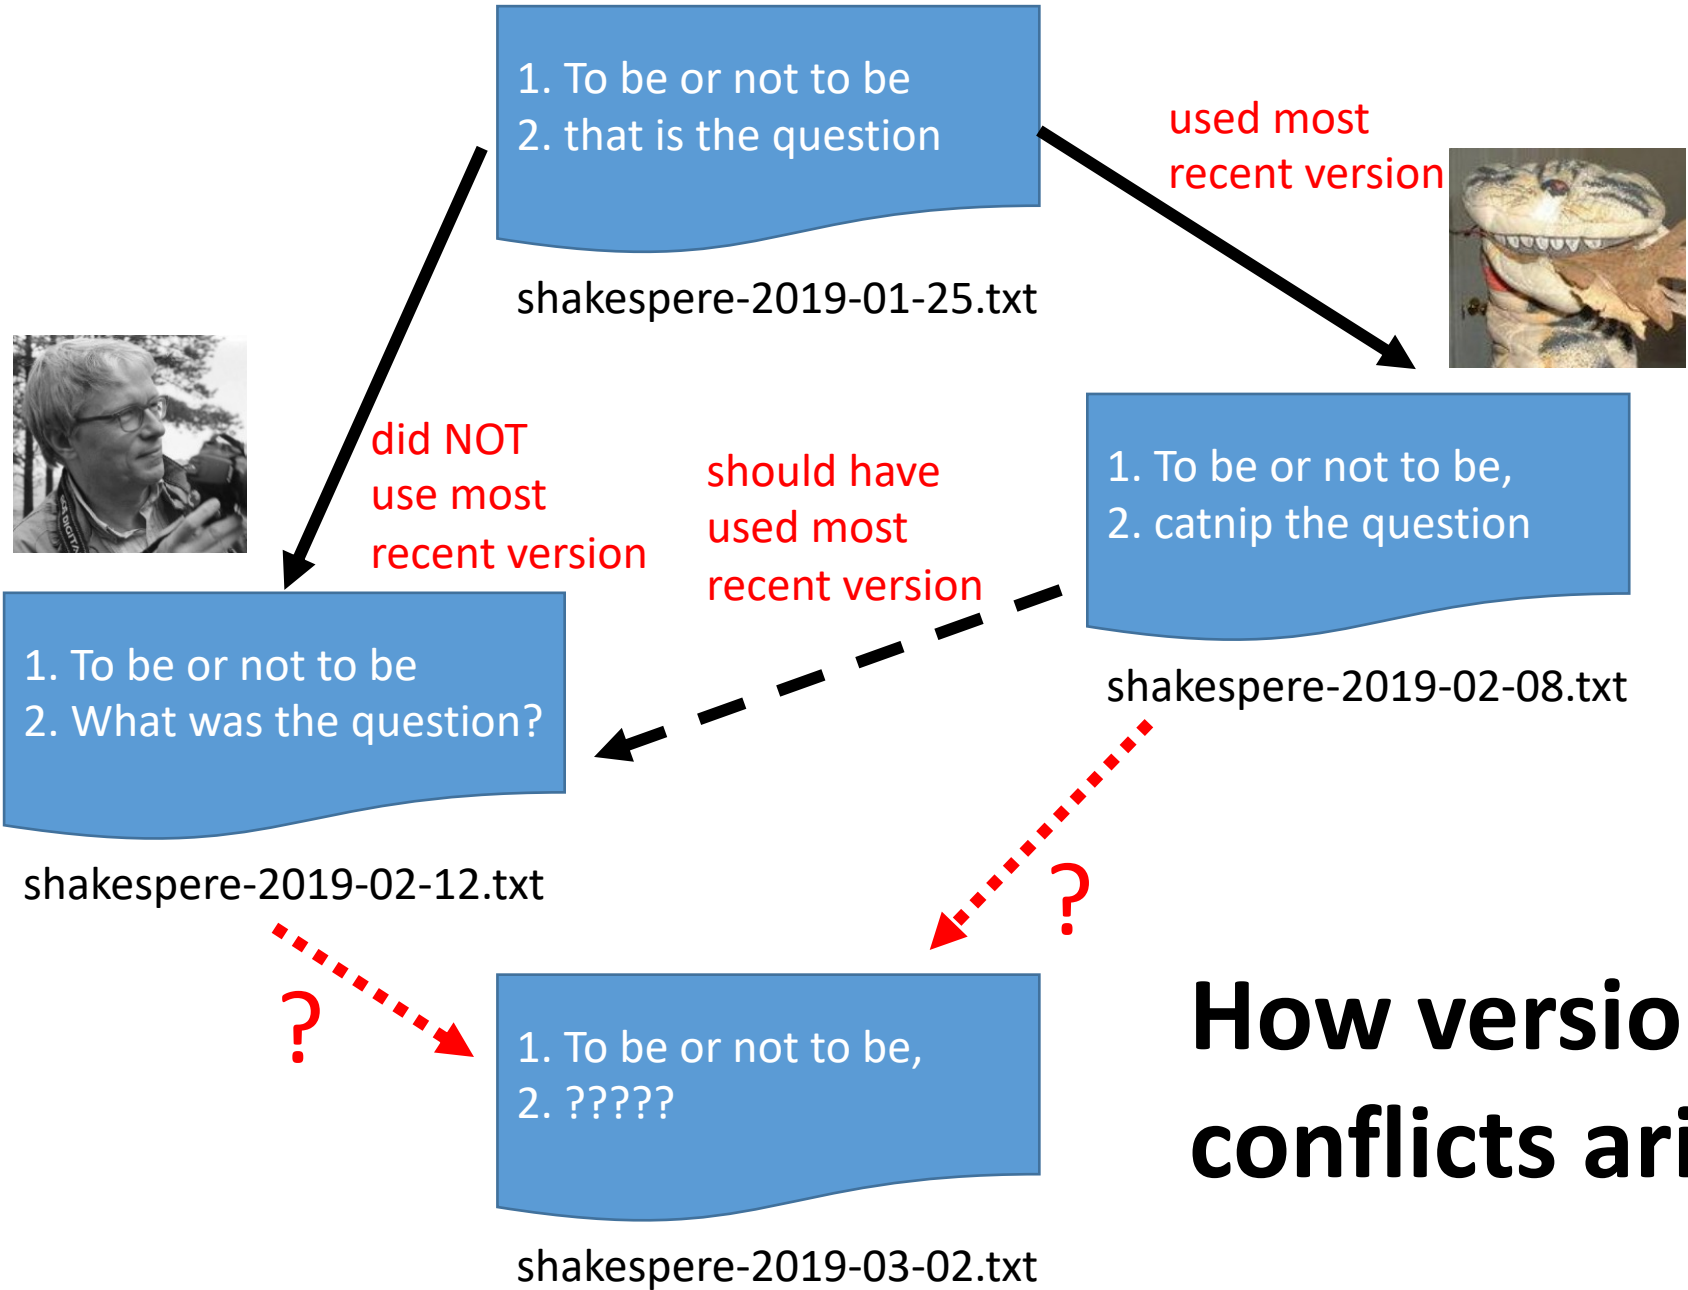

Variation in use of GitHub

- Depends on number of collaborators in the group
- Depends on who has write access to the repository
- Depends on social conventions established by the group

Disaster prevention via synching with GitHub (1 user)

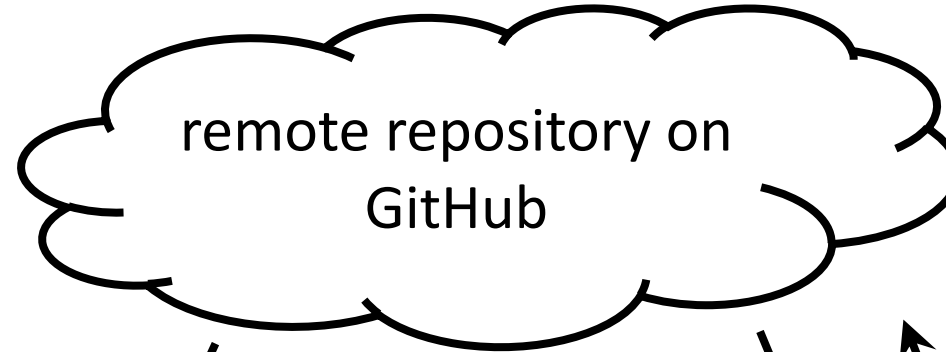

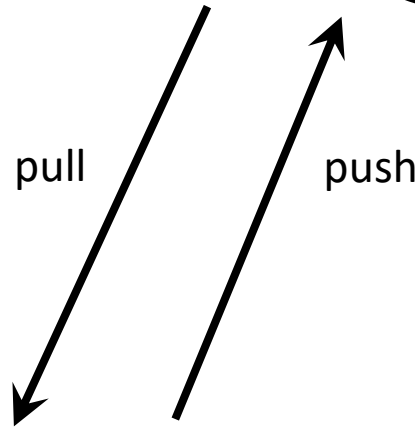

How version conflicts arise

Simple collaboration (>1 user)

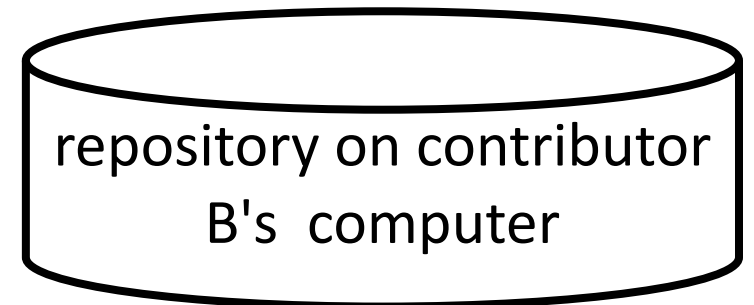

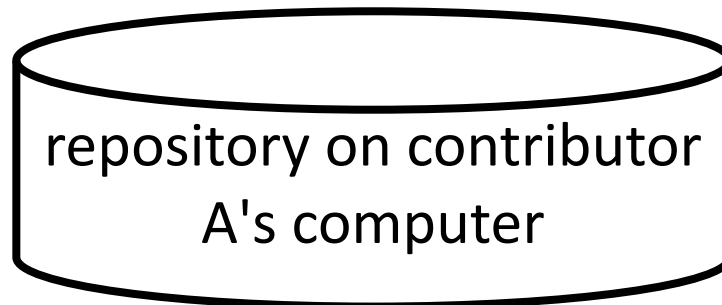

online copy of repository

Warning! High probability of version conflicts!

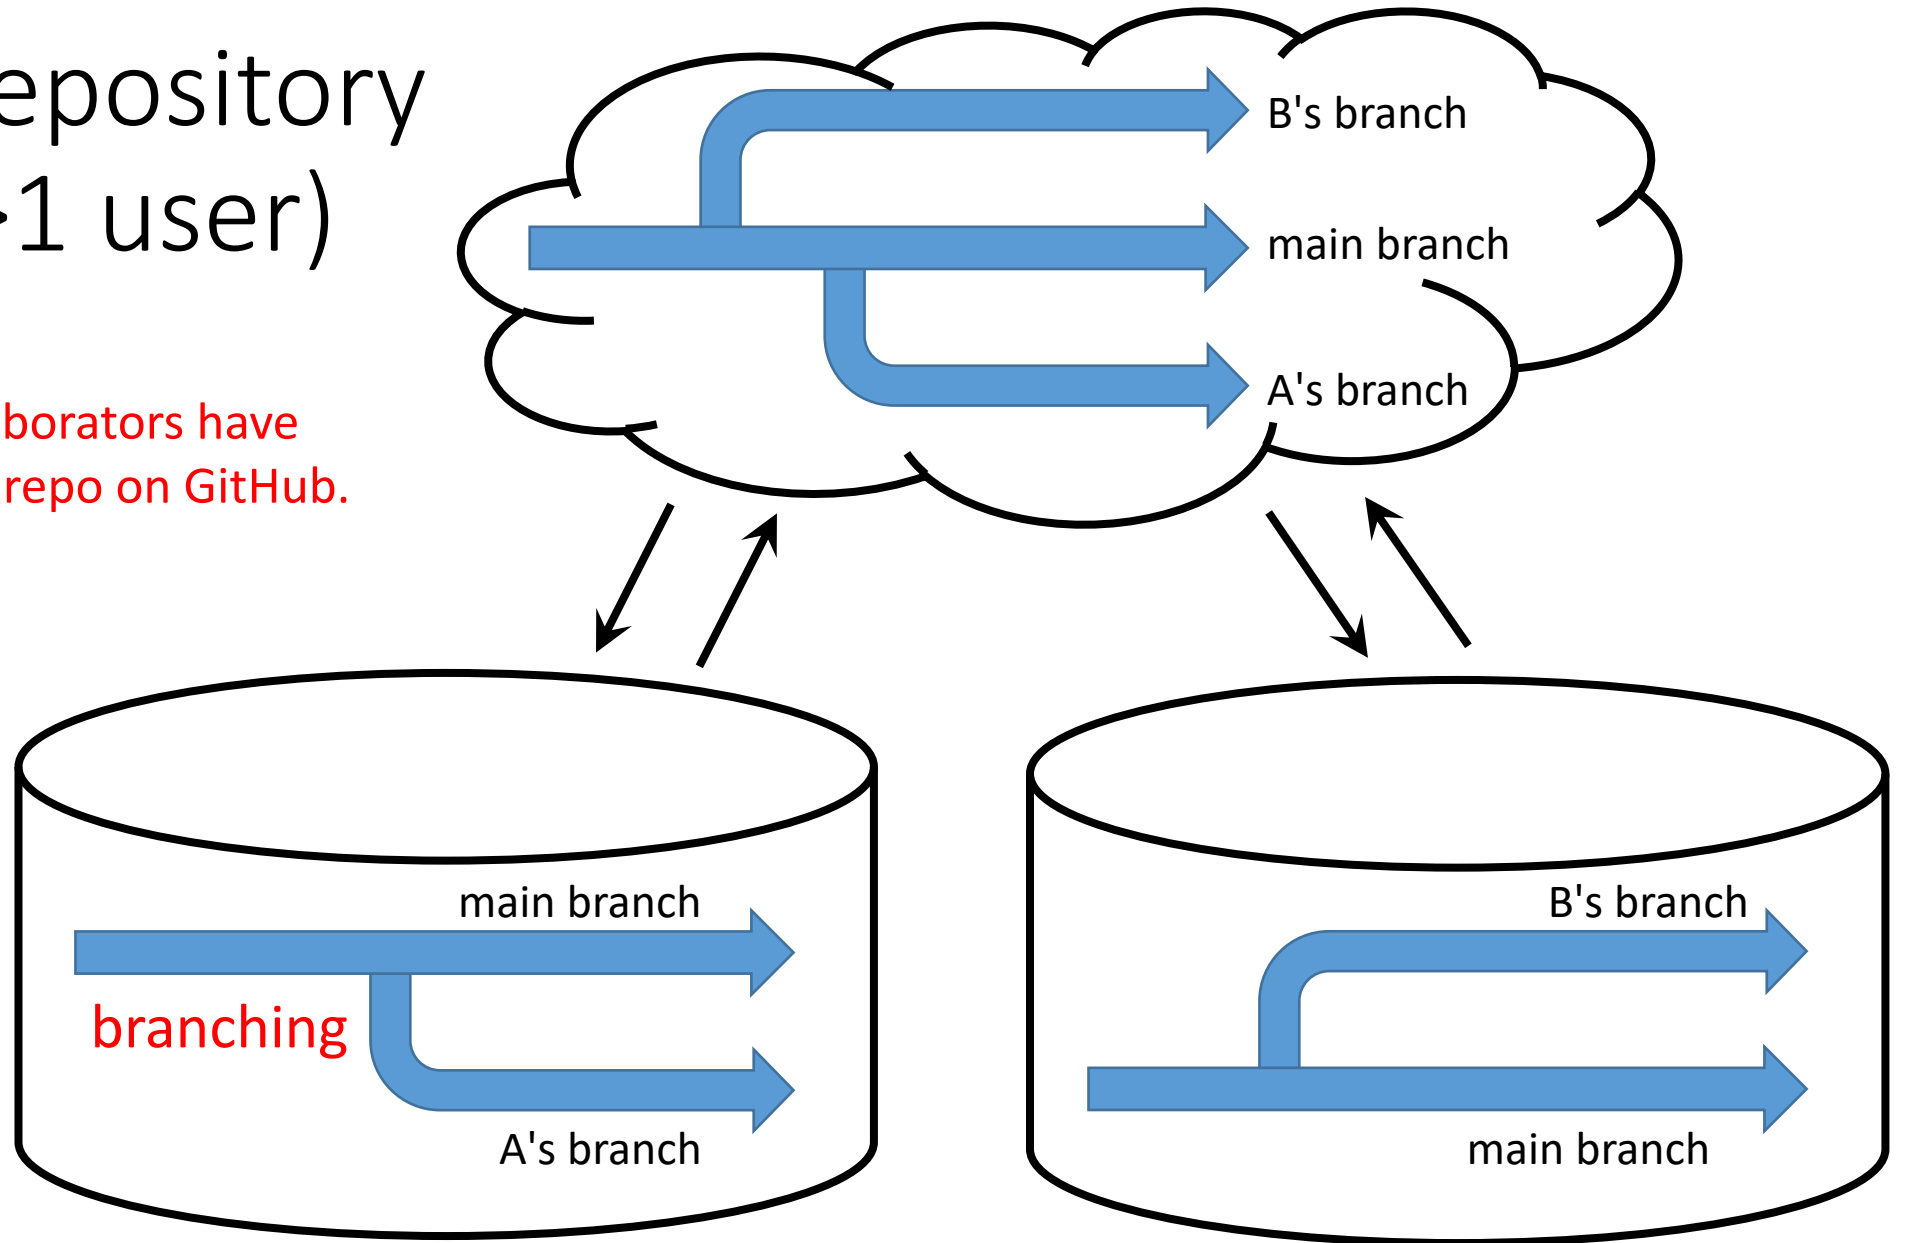

clones of GitHub repository

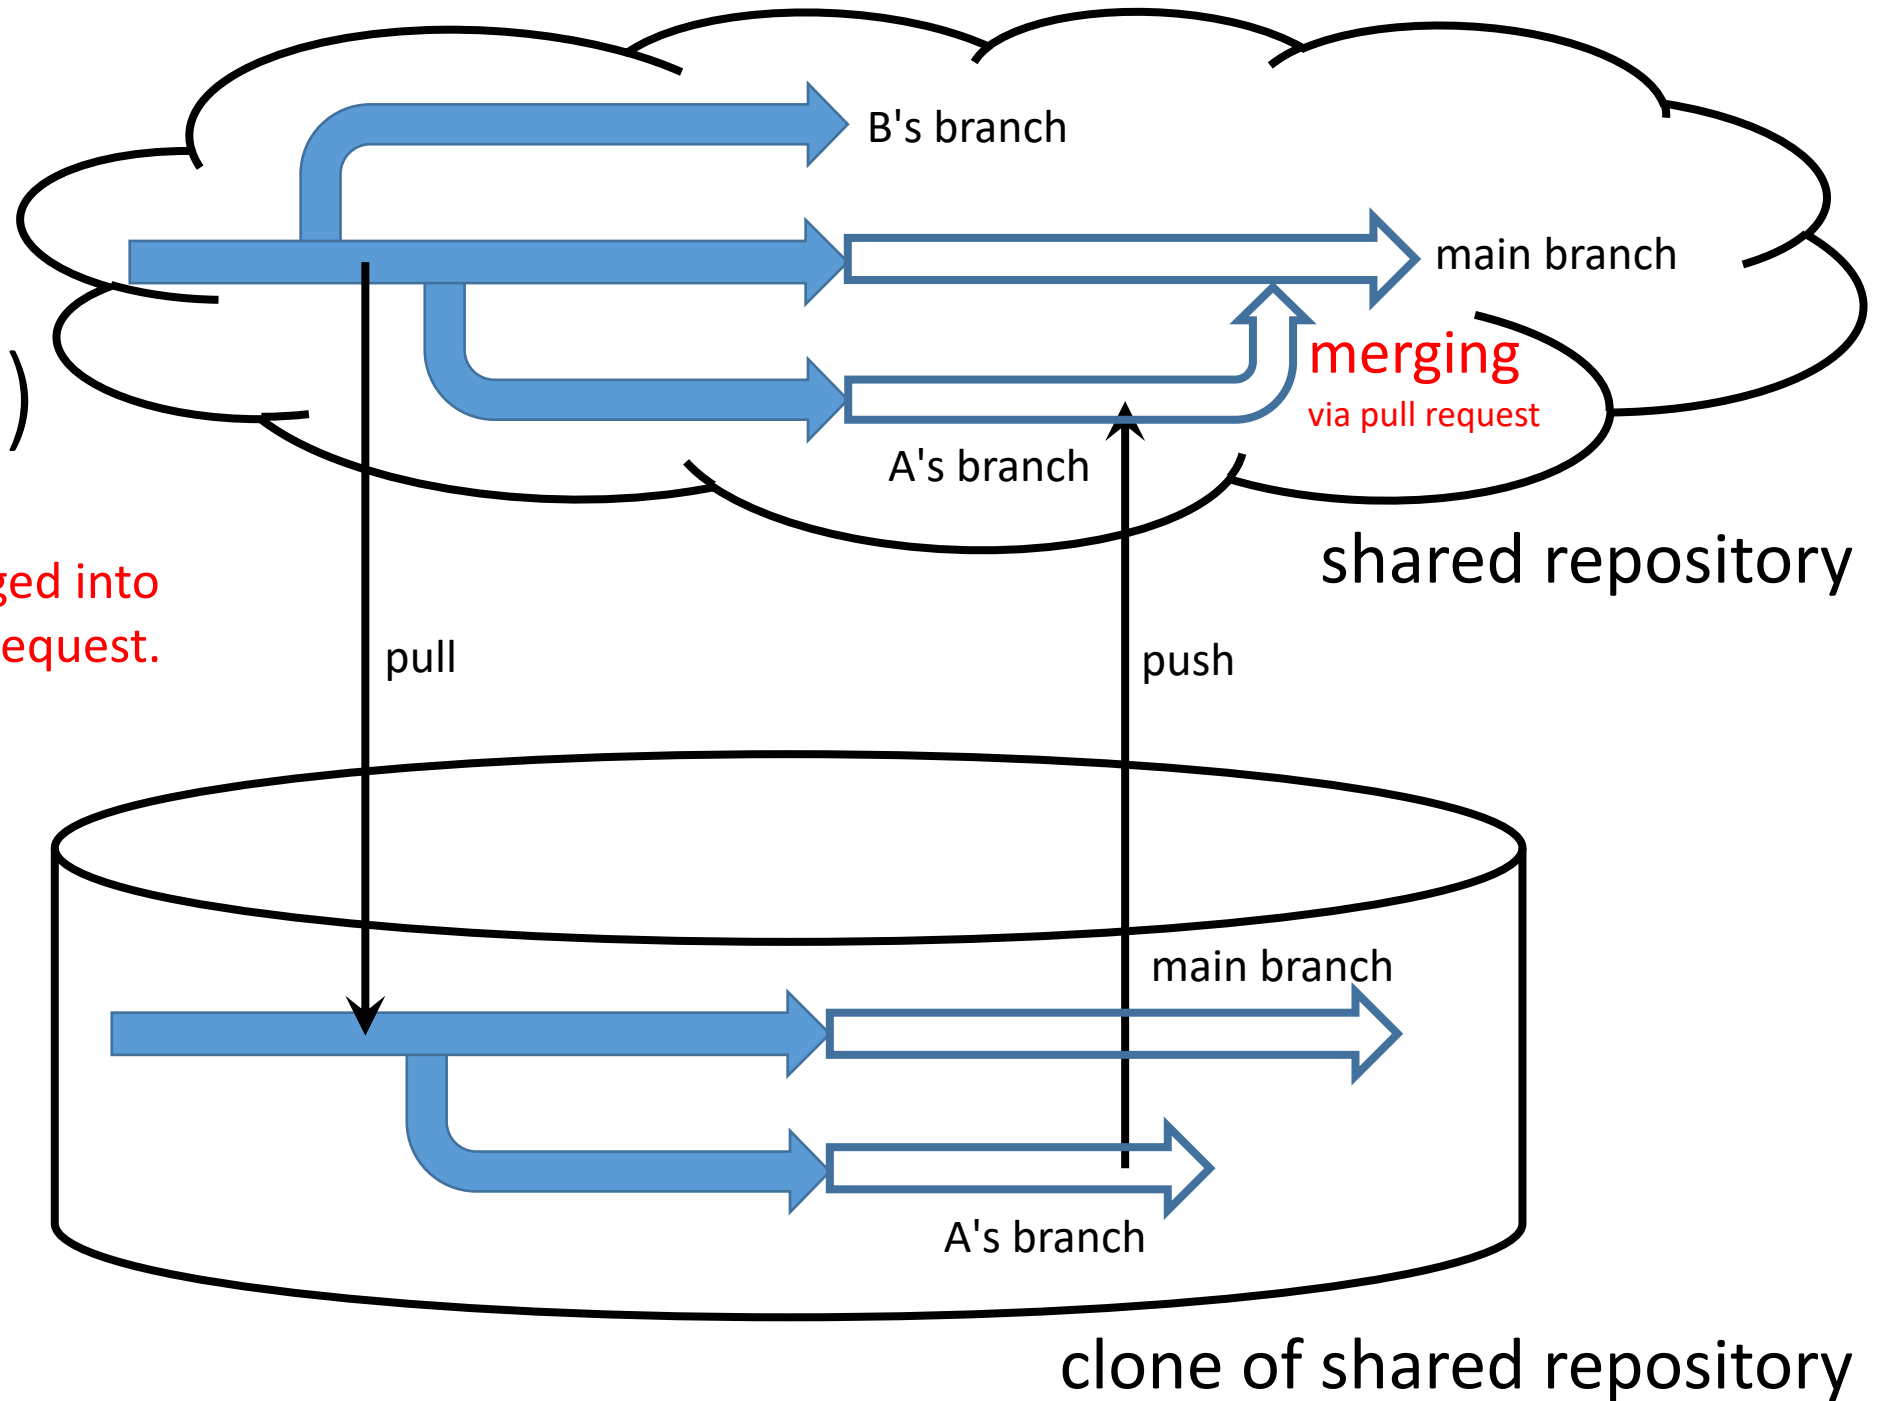

Shared repository model (>1 user)

Used when all collaborators have write access to the repo on GitHub.

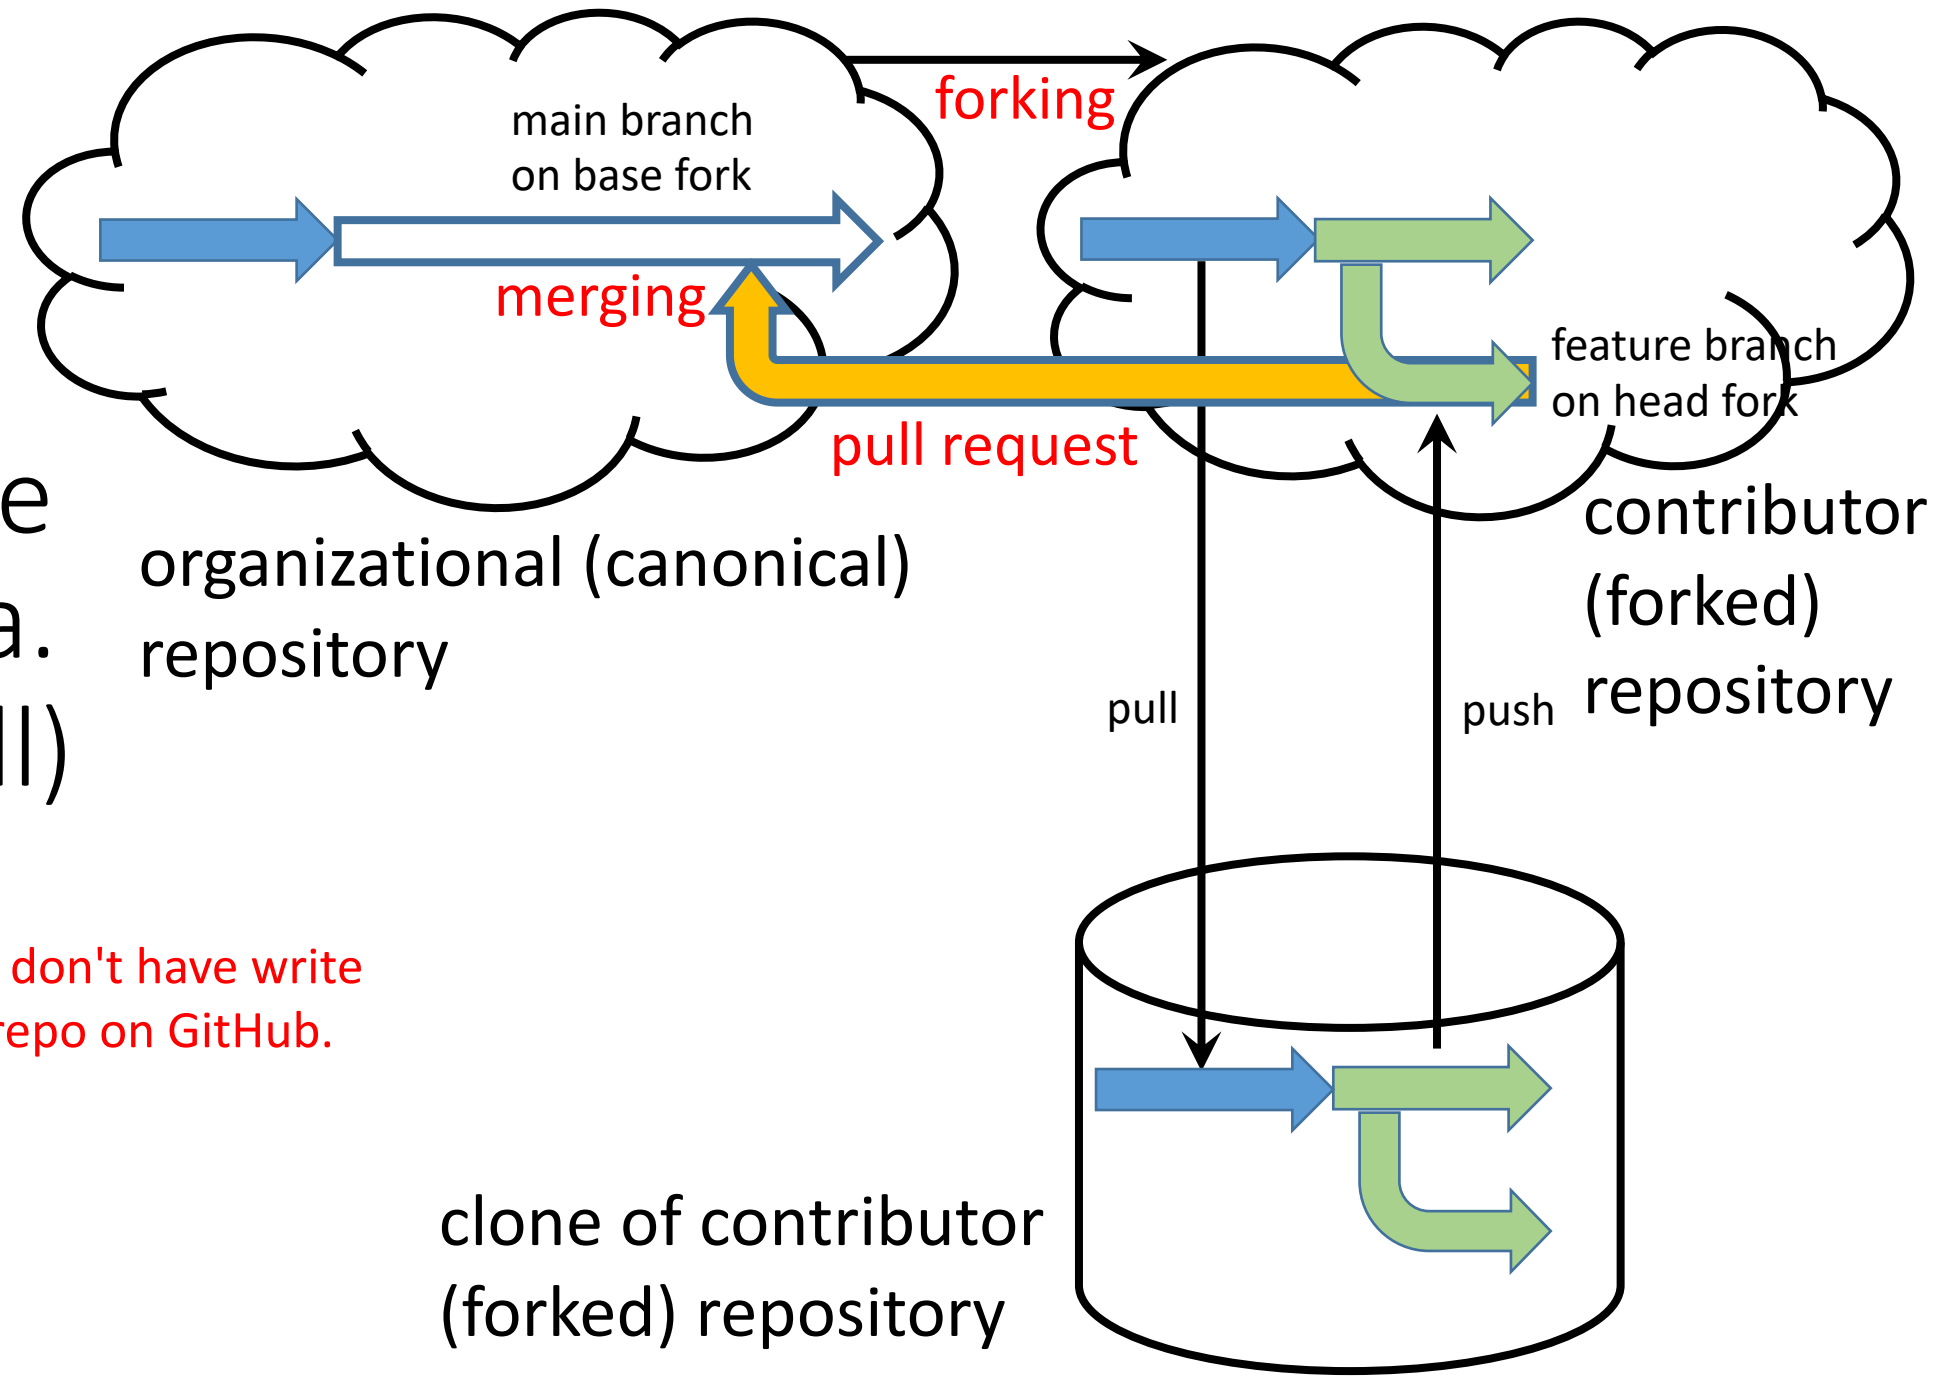

Version conflicts avoided when working on separate branches

GitHub flow (social conventions)

Open Source model (a.k.a. fork and pull)

Used when contributors don't have write access to the canonical repo on GitHub.

Managing a website using GitHub Pages (single user)

online copy of website

rendered to website by Jekyll (time delay)

local copy of website

push (nearly instantaneous)

Cloning a repo to the desktop
